

Input image

```
graph TD; A[Input image] --> B1[CNN 1]; A --> B2[CNN 2]; B1 --> C1[reduction 1]; B2 --> C2[reduction 2]; C1 --> D1[reduced 1]; C2 --> D2[reduced 2]; D1 --> E[Concatenate]; D2 --> E; E --> F[Supervised classifier]; F --> G[Clear / Obstructed];
```

The diagram illustrates a dual-CNN architecture. It begins with an 'Input image' box at the top. This input is split into two parallel paths. The left path consists of 'CNN 1', followed by 'reduction 1', and then 'reduced 1'. The right path consists of 'CNN 2', followed by 'reduction 2', and then 'reduced 2'. The outputs of these two paths, 'reduced 1' and 'reduced 2', are combined in a 'Concatenate' step. This concatenated output is then processed by a 'Supervised classifier', which finally produces the classification result: 'Clear / Obstructed'.
